This chart describes the composition of the total number of inhabitants in Belgium. For readability purposes we chose to only show regions, provinces and districts as also incorporating municipalities (the smallest subdivisions) made the figure a lot less readable.

The different colors represent the three main regions, which are the three values in the innermost circle. The middle circle then represents the different provinces in which each region is divided. Finally the outer circle represents each region's different districts.

The sectors are arranged in a way that they depend on the related sector of its inner band. The area of the sectors indicates the portion of population living in that region. For example, the total population of "Waals Gewest" is divided among all sectors below it (Henegouwen, Luik, Namen, Waals-Brabant, Luxemburg). The exact area of a sector thus only makes sense when comparing to the sectors in the same band segment.

This graph is intended to show how Belgium is roughly divided up in terms of population. Here we are not interested in the exact number of inhabitants, but more in how different locations compare to one another. We can clearly see that "Brussel-Hoofdstad" has the most inhabitants of all districts in Belgium.
